Abstract - Through quantitative and qualitative account (mixed explanatory method), this empirical investigation portrayed a pragmatic perspective of the primary health care services in Mbale District, Uganda under the fiscal decentralization with revenue autonomy in particular. The evidence based data were elicited from the respondents selected through purposive sampling utilizing a researcher devised research tool tested scientifically for its validity and reliability. Quantitative measurements consisted of means and standard deviations elucidated by qualitative data from observations and interviews. The constructs of primary health care services under study were as follows: public education, maternal and child health care, proper nutrition, provision of accessible treatment and drugs, clean water and sanitation, immunization and local diseases control, accountability in service delivery. The general findings revealed existing challenges and gaps in these indicators. Therefore, this study advocated the need for improvement of health services delivery outcomes in rural and remote communities through improved access to health services while this study also recommended that progress can be made by reflecting on enhancing service access through the wider implementation of innovative options proposed in this study.

Keywords: Innovative options, primary health care services delivery, revenue autonomy.

I. INTRODUCTION

This empirical investigation embarked on the prevailing scenario in Mbale District Uganda related to the primary health care services under revenue autonomy. Based on the findings, innovative options for generating own source revenue was underscored to address the challenging issues derived from the evidence-based data.

The autonomy of sub-national governments and division of functions by level cannot be sustained not unless there is empowerment for appropriate primary health care services delivery. The health sector was expected to report improvement in the form of increased utilization of health services, better access to health services, more coverage of the population with basic services, better quality of healthcare and ultimately, a decline in the rate of illnesses and deaths (Jeppson, 2000). In order to meet those expectations, major investments have been made in physical infrastructures such as the construction of health centers and the introduction of a general increment in the level of financing for the sector (Ministry of Health, 2013). Despite these efforts and expectations,(1) recurrent budgets under the primary health care grants have gaps; (2) the health sector in all the districts health center have performance challenges with conspicuous issues in the aspects of staffing, availability of drugs and equipment, absenteeism of health workers and accountability mechanisms (ACODE, 2014).

Okidi and Guloba (2006) spelled out that Uganda's fiscal decentralization system empowers local governments to access revenues for adequate financing for devolved responsibilities. The local governments execute their functions using resources transferred from the center, mobilized locally, and directly received from donors. Fiscal decentralization comes in these forms of grants (conditional, unconditional and equalization grants). The conditional grants (about 80 percent of transfers from the center) largely comprise the Poverty Action Fund, which is to be spent on centrally determined priorities (Kamugisha, 2014).

Fiscal decentralization is an issue of considerable practical importance facing many developing economies and has been championed by international bodies such as the World Bank and the Organization for Economic Cooperation and

Volume 6, Issue 6, pp 126-134, June-2022

https://doi.org/10.47001/IRJIET/2022.606016

Development (World Bank, 2003). Some writers describe the term fiscal decentralization as *central-local* (or intergovernmental), *fiscal relations* by European writers and *fiscal federation* by American writers. Intergovernmental fiscal relations focus on the fundamental problem of allocating expenditure and revenue responsibilities among levels of government (Ebel & Yilmaz, 2002).

Under Uganda's decentralization, local governments are expected to finance 10 percent of their budget and to fulfill their obligations; they exercise devolved powers to raise revenue locally from cities, municipalities, town councils and rural areas. In the rural areas, local government revenue is collected by sub-county officials, who retain 65 percent of the revenue (for local administrative expenditures) and remit the rest to their local government headquarters (Okidi and Guloba, 2006).

The allocation of income sources refers to the distribution of fiscal resources among the different levels of government. It ensures sub-national autonomy, promotes accountability and ownership, realizes decentralization efficiency gains and facilitates cash flow management (Ebel & Yilmaz, 2002). The revenue potential economic efficiency (revenue instruments structured to minimize economic distortions in investments, production, consumption and local decisions) is a basic principle in allocating revenue sources (Ebel & Yilmaz, 2002).

A weak revenue administration, is a primary obstacle to successful sub-national revenue mobilization (Boex and Martinez, 2005) where the problems range from lack of citizen credibility, lack of political will, enforcement is practically non-existent, and the revenue base information is lacking, incomplete or outdated (Ebel & Yilmaz, 2002).

In order to generate more local resources, sub-national governments should discover more potential sources of revenue. Hence the central government should devolve more tax levying powers to lower tier governments in order to increase their sources of revenues, which later will relieve the central government in the form of grants transfers. Restructuring of resource allocation and establishment of resource sharing mechanisms should be reintroduced.

Primary Health Care Services Delivery under Revenue Autonomy

A study carried out by Advocates for Coalition and Environment (ACODE) in 2015 revealed that one of the main factors affecting the public service delivery of Mbale District was budgetary constraints. The district only raised 2 percent of its total budget in 2013/2014 fiscal year far from the government-set target of 10 percent. Currently, in order to

deliver primary health care services among others, the district administration generates revenue from the levy of property taxes, licenses, fines and user fees. The local governments cannot levy taxes from acceptable sources and get non-tax revenue. Kamugisha (2012) argues that despite some fiscal autonomy being given to local districts to levy taxes, many of these sources have been cut off.

People living in small rural and remote communities of Mbale face significant health disadvantage. Generally, mortality and illness levels increase with distance from major sites (Kamugisha 2012).

Moreover, these communities are characterized by higher hospitalization rates and higher prevalence of health risk factors compared with metropolitan areas. These rural and remote communities are further underprivileged by condensed access to primary health care (PHC) services, leading, in turn, to lower utilization rates than in urban areas and consequent poorer health status for rural residents.

II. MATERIALS AND METHODS

Location of the Study area

This study was confined to Mbale district, The District boasts of 48 health facilities of which 43 are government-owned while the rest are private not for profit (PNFPs). OPD utilization in Health facilities in Mbale District in Government and PNFP facilities was 0.9 visits per person per year during 2010/11. In addition, 50% of mothers still delivered without supervision of qualified health professional which put the lives of both the mothers and babies at risk.

The study covered the local government health units, the district health team, and office of the District Director of Health Services (DDHS), the selected health centers are but not limited to; Kaplelko health center II, Mukuju health center IV, Chemnet dispensary, immaculate nursing home, Katung child development center, Bison Health center II, Kasoli health center II, and Kwoti health center II.

The research strategy employed in this study was the mixed explanatory method to elicit both quantitative and qualitative data relevant to the constructs of primary health care services. From a 170 target population,

https://doi.org/10.47001/IRJIET/2022.606016

Sketch Map of Uganda Showing the Location of Mbale District (Study Area)

Sampling

The stratified sampling method was executed to decipher the sample from various types of respondents (health workers, community members, and local district health officials) and arrive at 120 qualified respondents based on non-probability sampling (purposive sampling) and unbiased selection through simple random sampling. Derivative elements of purposive sampling technique utilized inclusion criteria on demographics (civil status, age, gender, education and number of year's experience). Data quality control was ascertained through construct validity and reliability testing with results that indicated acceptability of the researcher devised 4 point scaled questionnaire matched with interview questions within the context of the following: construct validity=.697/acceptable (Hutcheson & Sofroniou, 1999); and Cronbach's alpha reliability coefficient=.968/good (George & Mallery, 2003). Item analyses in means and standard deviations elicited quantitative data on the indicators of primary health care services delivery in logical order based on the highest means (public education, maternal and child health care, proper nutrition, provision of accessible treatment and drugs, clean water and sanitation, immunization and local diseases control, accountability in service delivery). Further, the qualitative data were collected through follow-up interviews.

Table 3.6.1 Validity of the data analysis

Items	Valid Items	Total Items	Validity
Fiscal Decentralization	20	20	100%
Primary Health Care Services Delivery	35	35	100%

The results in table 3.6.1 indicate that 20 items were used (Fiscal Decentralization) and 35 items were used on the Fiscal Decentralization and Health Service Delivery valid based on the contents of the instrument.

Content Validity Index (CVI) = The number of relevant questions

The total number of questions

Table 3.6.2 Cronbach's alpha of coefficients for reliability instrument

Items	Cronbach's Alpha	Number of items
Primary Health Care Services Delivery	0.810	35

Guide: Item-Total statistics

Cronbach's alphas of 0.8110, which indicates a high level of Primary Health Care Services Delivery for our scale with this specific sample.

III. DATA ANALYSIS

All the information from the questionnaires was entered into Microsoft excel spreadsheets and SPSS. The SPSS and the Microsoft excel program was used to generate descriptive statistics, graphics, tables and charts. The interpretation of the descriptive statistics made it possible to formulate appropriate inferences in terms of determining the influence of fiscal

ISSN (online): 2581-3048 Volume 6, Issue 6, pp 126-134, June-2022

https://doi.org/10.47001/IRJIET/2022.606016

decentralisation to the district's health service delivery performance. The qualitative data was analyzed into themes and concepts. Based on the grounded theory plausible relationships among themes and concepts were identified (Strauss & Carbin, 1998).

The following mean range was used to arrive at the mean of the individual **indicators and interpretation:**

Mean Range	Response	Interpretation
3.26 - 4.0	Strongly Agree	Very High
2.51 - 3.25	Agree	High
1.76 - 2.5	Disagree	Moderate
1.0 - 1.75	Strongly disagree	Low

Pearson's linear correlation coefficient and regression analysis was used to establish whether there was a significant relationship between Fiscal Decentralization and Primary Health Care Services Delivery.

IV. RESULTS

The demographics of the 120 respondents highlighted in this study were in terms of (1) civil status: married (47.5%), single (43.3%), divorced (7.5%) and the separated at 1.7%; (2) age and gender: majority were between 21-29 years (39.2%); 70.0% were male and 30.0% were female; (3) level of education: certificate (16.7%); diploma (26.7%); bachelors degree (36.7%); masters degree (15.8%) and doctoral (4.2%); (4) number of years experience with the health sector: less

than 6 months (8.3%), 6 months-1year (13.3%),1-2years (24.2%), 3-5years (26.7%) more than 5 years (27.5%).

Primary Health Care Services Delivery under Revenue Autonomy

Figure 1 summarized the primary health care services delivery determined in this study based on 7 constructs and were arranged from the highest to the lowest average means and all were interpreted as high in terms of gaps: public education (2.84); maternal and child health care (2.74); proper nutrition (2.74); provision of accessible treatment and drugs (2.72); clean water and sanitation (2.69); immunization and local disease control (2.69); and accountability in service delivery (2.60). These specific indices under each construct were found among other indices reflecting some gaps and challenges in the primary health care services delivery:1) public education (assessing individual and community needs for health education=2.73); 2) maternal & child healthcare (importance of hand washing as hygienic measure most especially for the children=2.68); 3) proper nutrition (emphasis on healthy diet=2.68); 4) provision of accessible treatment & drugs (easy road for the patients to move=2.68); 5) clean water and sanitation (unsafe water from rainfall reaching drinking waterways=2.61); 6) immunization and local diseases control (treatment of animals to control spread disease=2.61); 7) accountability in service delivery (signing for drugs taken in and out of the health center=2.14).

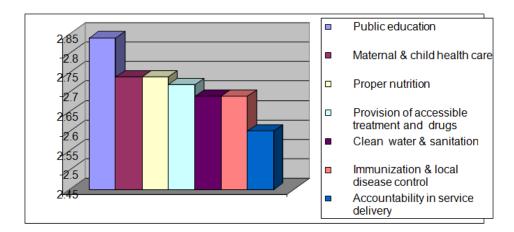

Figure 1: Primary Health Care Services Delivery under Revenue Autonomy Legend for interpretation of the means

V. DISCUSSIONS

People living in small rural and remote communities of Mbale face significant health disadvantage. Generally, mortality and illness levels increase with distance from major cities. Moreover, these communities are characterised by higher hospitalization rates and higher prevalence of health risk factors compared with metropolitan areas. These rural and remote communities are further disadvantaged by reduced access to primary health care (PHC) providers and health services (in part a function of health and medical workforce shortages), leading in turn to lower utilisation rates than in urban areas and consequent poorer health status for rural residents.

ISSN (online): 2581-3048 Volume 6, Issue 6, pp 126-134, June-2022

https://doi.org/10.47001/IRJIET/2022.606016

A dynamic health system that is able to monitor and respond to unforeseen challenges, including demographic transitions and changing health needs, is required. At the macro and meso level of health care delivery, it is important that health system development be coordinated with areas of development, such as social, economic and environmental development. Thus re-engineering of primary health care and the implementation of the National Health Insurance System could provide a mechanism to redress current health inequalities in Mbale. However Sanders et al (2011) argue that the impact of neoliberal economic policies and the broader impact of economic forces on primary health care delivery must be considered. Regulation of the market is required if revitalisation of primary health care and progress towards health equity is to be realized.

Primary health care requires structural re-organisation, multidisciplinary team approach with clear lines of accountability, clear referral patterns in a two-way direction, improved access to health insurance to improve health coverage, and developing effective public-private partnerships. The universal core packages of health care should be evidence-based, cost-effective and appropriate to local needs.

Policy development on integrated health care generally fails to guide the translation of policy rhetoric into health action. The delays in health integration are largely due to the current lack of clear direction and accountability at district and institutional levels. Effective leadership is required in terms of policy formulation and translation into practice, development of monitoring tools for assessment of the health system including the burden of disease, utilization of health services, and effectiveness of health interventions. There is a need for renewed political and policy commitments toward quality primary health care delivery, re-orientation of health care workers, integration of primary health care activities into other community-based development, improved management skills and effective coordination at all levels of the health system. There should also be optimal capacity building, and skills development in problem-solving, communication, networking and partnership formation. Apart from capacity building, there should be incentives to motivate health personnel and support career development.

Often these isolated rural and remote communities are too small to support traditional models of health delivery locally, so residents must access care from larger urban centres. Unfortunately, access to health services provided in larger centres remains a problem for many residents of isolated settlements. In many cases, their inability to access health services when required results in health needs not being adequately met, lack of continuity of care and an absence of

monitoring of the effectiveness of services in terms of health outcomes. It is clear that 'models of care in rural and remote areas must differ from those in metropolitan communities, incorporating strategies to account for these problems'.

Drawing on information about model type, location and service population size, it was evident that in general the different categories of models relate to different geographical contexts, with a notable association with population size and remoteness. While larger rural communities are generally able to support a greater variety of local, discrete, more specialised health care services, increasing remoteness and diminishing population size and density constrain service model options and increase the impetus for the development of more integrated and comprehensive primary health services in order to maximise the economies of scale and use of existing health workforce.

Disease prevention and health promotion

These factors outlined have important implications for the delivery of district health services. Inconsistencies and poor understanding of primary care and primary health care raises unrealistic expectations in service delivery and health outcomes, and blame is apportioned when expectations are not met. At the micro level of health delivery, it is important for all health practitioners to consider the contextual influences on health and ill-health and to recognise the role of the underlying determinants of ill-health, namely, social, economic and environmental influences. Comprehensive primary care using strategies of the primary health care approach could focus on integrated health care delivery, where individuals and communities are managed holistically. This includes the recognition that chronic diseases as a result of lifestyle practices, will result in a number of disease presentations for example unhealthy dietary practices are linked to obesity, dental caries, cardiac complications, diabetes, etc. Thus strategies to address the risks to unhealthy lifestyle practices must recognise the role of optimal oral health and nutritional status in improving overall health outcomes. These would include the need to create supportive environments to promote the selection of healthier choices. The primary health care approach provides a strong framework for this delivery but it is not widely applied. The primary health care framework also allows for assessment of the quality, appropriateness and impact of service delivery, the identification of gaps, and research development. Healthy living and family self care initiatives will make significant contributions to foster individual and community empowerment if there is coordinated effort to focus on disease prevention and health promotion.

ISSN (online): 2581-3048 Volume 6, Issue 6, pp 126-134, June-2022

https://doi.org/10.47001/IRJIET/2022.606016

The World Health Assembly resolution on primary health care (2009) reiterates 'the importance to reorganize disease- or health problem-specific (vertical) actions through comprehensive (horizontal) primary health care. The focus of this resolution is 'to train and retain adequate numbers of health workers, with appropriate skill mix, including primary health care nurses, midwives, allied health professionals and family physicians, able to work in a multidisciplinary context, in cooperation with non-professional community health workers in order to respond effectively to people's health needs.

Public Education: Public education is the first, and one of the most essential components of primary health care. By educating the public on the prevention and control of health problems, and encouraging participation, the World Health Organization works to keep disease from spreading on a personal level (McKenzie, Neiger, Thackeray 2009). Education for health begins with people (Donatelle, 2009) and further impresses that,

"It hopes to motivate them with whatever interests they may have in improving their **living conditions**. Its aim is to develop in them a sense of responsibility for health conditions for themselves as individuals, as members of families, and as communities. In communicable disease control, health education commonly includes an appraisal of what is known by a population about a disease, an assessment of habits and attitudes of the people as they relate to spread and frequency of the disease, and the presentation of specific means to remedy observed deficiencies" Donatelle, 2009.

Health education does not only teach prevention and basic health knowledge but also conditions ideas that re-shape everyday habits of people with unhealthy lifestyles in developing countries. This type of conditioning not only affects the immediate recipients but the future generations will benefit from improved and properly cultivated ideas about health education (Donatelle, 2009).

Maternal and Child Health Care: Ensuring comprehensive and adequate health care to children and to mothers is another essential element of primary health care according to Ikeanyionwu (2000). By caring for those who are at the greatest risk of health problems, WHO helps future generations have a chance to thrive and contribute globally. Every parent would surely wish to nourish their children in a loving, caring and secured atmosphere. The parents would want to give proper care and attention to the little ones, especially during their initial stages of development.

Proper Nutrition: Eating a proper, nutritious diet offers numerous health benefits that keep individuals mentally and

physically well. Proper nutrition does not mean starving oneself, but instead, proper nutrition means eating a diet balanced in lean proteins, carbohydrates and fats. Mayo Clinic, which is among the top 10 best health organisations in the USA recommends in its 2012 annual report getting between 45 and 65 percent of daily calories from carbohydrates, between 10 and 35 percent of daily calories from proteins and between 20 and 35 percent of daily calories from fats.

Provision of accessible treatment and drugs: By treating disease and injury at once, caregivers can help avoid complications and the expenses for more extensive medical treatment. According to Kann (2001) by providing essential drugs to those who need them, such as antibiotics to those with infections, caregivers can help prevent disease from escalating, This makes the community safer, as there is less chance for diseases to spread widely.

Clean water and sanitation: A supply of clean, safe drinking water and basic sanitation measures regarding trash, sewage and water cleanliness can significantly improve the health of a population, reducing and even eliminating many preventable diseases (Pariyo *et al.*, 2009). Nowhere is the relationship between healthy ecosystems and healthy people more apparent than in the global water system. Clean water is the single most important building block of ecosystems around the world, says the Centers for Disease Control and Prevention (Hagopian *et al.*, 2009).

Immunization and Local Diseases Control: Prevention and control of local diseases is critical to promoting primary health care in a population. Many diseases vary based on location (Inanga & Osei-Wusu, 2004). Taking these diseases into account and initiating measures to prevent them are key factors in efforts to reduce infection rates.

Accountability for Services Delivery: The delivery of health services is one of the primary objectives of any government. Particularly under the local government act of Uganda, medical and health service delivery are generally considered decentralized services.

VI. CONCLUSIONS

Insights and new meanings: (a) Responsiveness and accountability of local government is important to note in favor of fiscal decentralization; (b) Diversity, education and leadership development are aspects for consideration in revenue autonomy;(3) Primary health care services delivery is a constituted effort of both central and local government, therefore, centralization and decentralization should have appropriate balance essential to effective and efficient

Volume 6, Issue 6, pp 126-134, June-2022

https://doi.org/10.47001/IRJIET/2022.606016

functioning; (4) Not all functions can or should be financed and managed in a decentralized fashion. Even when national governments decentralize responsibilities, they often retain important policy and supervisory roles.

Pragmatic Perspective of the Primary Health Care Services Delivery under Revenue

Autonomy: With due justice to the true meaning of pragmatic view (reasonable and logical way of dealing with an existing problem in a specific situation), in this study then, creating or maintaining *enabling conditions* that allow local units of administration or non-government organizations to take on more responsibilities as in the case of primary health care services delivery should not be underestimated.

Proposed Innovative Options Within Own Source Revenue

Rationale: In order to generate more local resources subnational governments should discover more potential sources of revenue for the district administration. Thus, the central government should devolve more tax levying powers to lower tier governments to increase their own sources of revenues, which later will relieve the central government in the form of grants transfers. Restructuring of resource allocation and establishment of resource sharing mechanisms need to be reintroduced.

Objective: To realize expectations of the community for better delivery of primary health services with local government officials being result-oriented.

Proposed Courses of Action and Implementation Strategies

- (1) Personalized sensitization projects for a focused understanding of health information (prevention of diseases, first aid, sanitary measures, safe water and sanitation, healthy diet, treatment of animals) through free clinics and health fares in collaboration with health oriented and health directed nongovernment organizations.
- (2) Integrated approach to primary health care services delivery: Rural communities require revitalization and rehabilitation regarding access, equipment, and workforce.
- (3) Provision of services in primary health care from close range for better chances of recovery and social integrations.: At the time of this research, some of the subcounties like Bukyiende and Bumasikye did not have health centers and most people in other sub-counties in the district are treated far from their homes because of the distances to the health facilities this disrupted normal daily life, employment and family life. It removed individuals from their normal

supports, essential to recovery, and it imposed more burden on families and caregivers.

- (4) Partnership with private sector organizations/PSO with impacts on the health system such as linking health insurance, laboratory services, medical supplies, safe water installations, food supplies, electronic recordkeeping for proper tracking and delivery of health records to the clients, research and evaluation methods to highlight health issues challenges, work efficiencies and effectiveness of health care delivery as bases for improvement and policy development.
- (5) Vigilant monitoring of accountability through internal and external audit interventions.

Target Periods and Persons Responsible: These are recommendations referring to the implementation time span of the proposed courses of action and individuals responsible (in brackets)

Personalized sensitization projects: Every three months (health officials and health providers); Integrated approach to primary health care services delivery: Year round (local and health authorities); Provision of services in primary health care from close range for better chances of recovery and social integrations: Year round (local and health officials, health providers); Partnership with private sector organizations/PSO with impacts on the health system: Year round (local and health authorities, PSO)

E. Vigilant monitoring of accountability: Quarterly (local and health authorities).

Expected Outcome Indicators: Within six months, the proposed courses of action must have reached obvious implementation at least above 50%. In the context of full implementation, by the end of the year, a 100% achievement status is underscored.
